**Computer science**  
**Higher level**  
**Paper 3**

Monday 1 November 2021 (morning)

1 hour

---

**Instructions to candidates**

- Do not turn over this examination paper until instructed to do so.
- A clean copy of the **computer science case study** is required for this examination paper.
- Read the case study carefully.
- Answer all questions.
- The maximum mark for this examination paper is **[30 marks]**.

Answer **all** questions.

- 1. (a) Identify **two** characteristics of a genetic algorithm. [2]
- (b) Outline what is meant by the term “elitism”. [2]

- 2. (a) Calculate the offspring from parents P1 and P2 using the cycle crossover (CX) method.

**P1**

B	A	G	C	J	D	H	E	F	I
---	---	---	---	---	---	---	---	---	---

**P2**

D	C	I	E	B	G	A	H	J	F
---	---	---	---	---	---	---	---	---	---

Show all your working. [4]

- (b) The partially matched crossover (PMX) operator is a genetic operator that can be used with a genetic algorithm written to solve the travelling salesman problem.

PMX combines two chromosomes (parents) to produce a new chromosome (offspring).

Outline how the parental characteristics (cities) are preserved when two offspring are generated through PMX crossover. [4]

- 3. Compare and contrast the effectiveness of heuristic and non-heuristic algorithms for optimizing solutions. [6]

- 4. Fenna has decided to use roulette wheel selection and cycle crossover (CX) for her genetic algorithm. She has two other important decisions to make:
  - What values to assign to the variables when they are first initialized. These variables include population size, initial population routes, and mutation rate.
  - What stopping criteria to use for the genetic algorithm.

Discuss the impact that these decisions may have on the success of the genetic algorithm. [12]
